Anton Karandeev

Senior C++ Software Engineer
Tbilisi, Georgia · Remote · International B2B contracting
tonygluk@gmail.com
linkedin.com/in/anton-karandeev

Senior C++ software engineer with 10+ years developing cross-platform software, including many years building C++/Qt/QML desktop applications on Windows and macOS. Experience spans desktop UI, multimedia, networking, and platform integration.

Experience

Technical Co-founder — Vorika **January 2026–Present**
Building a pre-launch AI English tutor, including a voice-conversation prototype and subscription infrastructure.

Career Break **November 2024–December 2025**

Senior Software Engineer — Teramind **January 2023–October 2024**

Developed and maintained a mature macOS endpoint agent for activity monitoring and data loss prevention, working across networking, platform integration, and application behavior.

- Owned the TCP proxy spanning the Network Extension (Swift) and the agent (C++/Boost.Asio). Implemented traffic analysis, improved TLS parsing, added extension-agent log correlation, and fixed connectivity issues.
- Replaced the blocking Endpoint Security client with an asynchronous implementation to prevent authorization timeouts.
- Developed a reusable C++ logging utility adopted across the project, standardizing diagnostic output and enabling filtering by module, connection, and state.
- Investigated screen lock detection issues across macOS versions; designed and implemented a state model that remained reliable on all supported machines.
- Reconstructed the undocumented configuration path for a policy feature previously available only in the Windows agent, tracing required values across different packet types and stages of the agent's runtime.

Janus Technologies / Moderro Technologies *(affiliated companies)* **October 2014–January 2023**
Software Engineer, later Senior Software Engineer. Developed C++/Qt applications for endpoint security management, secure workstation, and help desk products on Windows and macOS.

- Drove a complete rewrite of the Qt RPC adapter, replacing nested event loops with an asynchronous implementation that supported concurrent requests and eliminated widespread retry workarounds.
- Built an application-wide QML scaling layer for Windows that handled runtime font changes and per-monitor DPI transitions.
- Implemented an application-wide visual redesign using Qt's QStyle/QProxyStyle infrastructure to customize widget appearance without modifying individual views.
- Co-developed a Qt-based endpoint activity viewer; built its multi-graph timeline and later took ownership of its FFmpeg-based dual-stream video player.
- Redesigned the viewer's event log around a structured event model, separating presentation from copy/export formatting and improving search highlighting.

Freelance iOS Developer — Arkuda Digital **July 2013–October 2014**

- Built and shipped a DLNA/UPnP audio application for iPhone and iPad; features included control of external playback devices, local playback, offline downloads, and music library organization.
- Implemented APE and FLAC playback using FFmpeg for demuxing, decoding, and resampling, with Audio Queue Services for output.

Technical Skills

Languages: C++ (10+ years), TypeScript, C, Objective-C, Swift (limited recent use)
Technologies: Qt/QML/Qt Quick, FFmpeg, Boost.Asio, libuv, CMake/qmake, Node.js, PostgreSQL, OpenSSL/TLS, macOS Network Extension, macOS Endpoint Security, PowerShell, WiX

Education

Voronezh State University — Specialist degree in Software Engineering, 2014
