Anton Karandeev

Senior C++ Software Engineer

Tbilisi, Georgia · Remote · International B2B contracting
tonygluk@gmail.com

Senior C++ software engineer with 10+ years of experience developing cross-platform software, with work spanning native desktop applications, networking, macOS platform APIs, multimedia, application architecture, and build/install tooling.

Experience

Technical Co-founder — Vorika **January 2026–Present**
Building a pre-launch AI voice tutor for Russian-speaking English learners.

- Built a voice-conversation prototype using an STT-to-LLM-to-TTS flow with audio-level-driven mouth animation for a Rive avatar.
- Implemented Paddle payment and subscription event processing with durable storage and background retries; failed events remain recoverable without blocking subsequent events.
- Prototyped a content-generation pipeline with automated validation, persistent jobs, and restart-safe workflows.

Career Break **November 2024–December 2025**

Senior Software Engineer — Teramind **January 2023–October 2024**
Developed and maintained a mature macOS endpoint agent for activity monitoring and data loss prevention, working across networking, platform integration, and application behavior.

- Owned the TCP proxy spanning the Swift Network Extension and the C++/Boost.Asio agent. Substantially rewrote it to correlate logs across the two components, improved TLS parsing, and fixed a proxying bug that broke VNC connections.
- Reconstructed the undocumented configuration path for a policy feature previously available only in the Windows agent, tracing required values across different packet types and stages of the agent's runtime.
- Reworked lock, sleep, and screensaver detection across macOS versions. Replaced logic that depended on notification timing and ordering with a unified state model, making state changes easier to reason about and bugs easier to diagnose.

Janus Technologies / Moderro Technologies *(affiliated companies)* **October 2014–January 2023**
Software Engineer, later Senior Software Engineer. Developed C++/Qt applications for endpoint security management, secure workstation, and help desk products.

- Built and shipped a synchronized dual-stream viewer for live and recorded video streams in a custom packetized format, using FFmpeg for decoding and supporting frame stepping and reverse playback.
- Replaced the Qt-side synchronous RPC adapter with a fully asynchronous implementation, eliminating a class of timing-dependent failures and simplifying the surrounding application code.
- Built an application-wide QML scaling layer for Windows that handled runtime font changes and per-monitor DPI transitions.
- Created PowerShell build orchestration and a WiX installer, supporting source builds of the product and its dependencies without external package servers.

Freelance iOS Developer — Arkuda Digital **July 2013–October 2014**

- Built and shipped an iPhone and iPad DLNA/UPnP audio application around the client's in-house DLNA/UPnP library, supporting control of external playback devices, local playback, offline downloads, playlists, and library organization.
- Implemented APE and FLAC playback using FFmpeg for demuxing, decoding, and resampling, with Audio Queue Services for output.

Technical Skills

Languages: C++ (10+ years), C, Objective-C, Swift (limited recent use), TypeScript
Technologies: Qt/QML, Boost.Asio, OpenSSL/TLS, FFmpeg, macOS Network Extension, macOS Endpoint Security (limited), qmake/CMake, PowerShell, WiX, PostgreSQL, Node.js

Education

Voronezh State University — Specialist degree in Software Engineering, 2014
